Dairy Herd Improvement Letter

ARS-44-18  
(Vol. 34, No. 2)

February 1958

## DAIRY RECORDKEEPING PASSES THE TWO MILLION-COW MARK

Dairy recordkeeping continued to increase and reached an all-time peak during 1957. More herds and cows were included in the National Dairy Herd Improvement Program on January 1, 1958, than ever before.

Standard DHIA - On January 1, 1958, there were 1,548,884 cows in the Standard Recordkeeping Plan. This is 69,085, or 4.7 percent, more cows than were in this plan on January 1, 1957.

Owner-Sampler - On January 1, 1958, there were 490,001 cows in the Owner-Sampler Recordkeeping Plan. This is 84,911, or 21.0 percent, more cows than were in this plan on January 1, 1957.

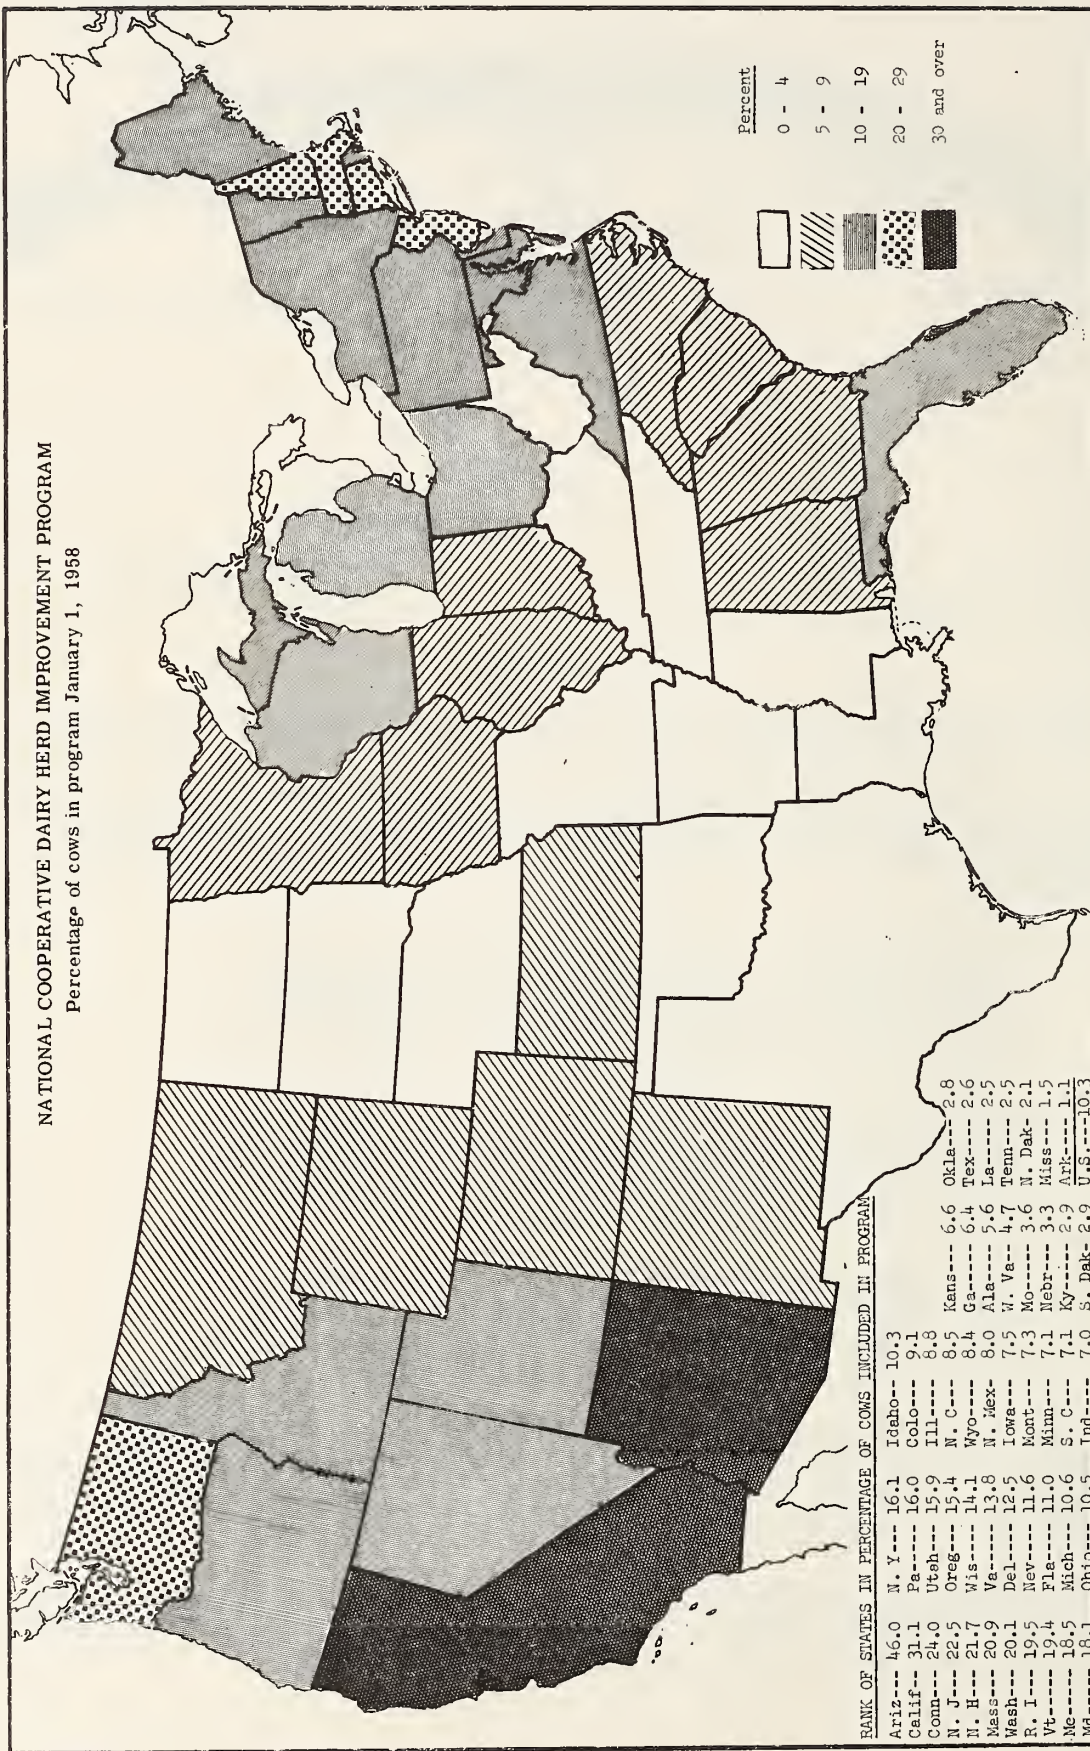

Weigh-a-Day-a-Month - On January 1, 1958, there were 79,489 cows in the WADAM Recordkeeping Plan. This is 58,192, or 273.2 percent, more cows than were in this plan on January 1, 1957.

The three plans which collectively make up the National Cooperative Dairy Herd Improvement Program included 64,883 herds consisting of 2,118,374 cows. This number represents 10.3 percent of the milk cows of the nation.

Complete data on the status of the National Cooperative Dairy Herd Improvement Program, by States, as reported by State Extension Dairy men, are given on the following pages.

# DHIA PROVED-SIRE RECORDS TABULATED IN JANUARY 1958

Following is a list of 300 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in January 1958. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., \*12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., \*May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
